Outstanding Features In Custom Engineered Cathode Ray Tubes

Sylvania Answers the Call for Custom Engineered Multi-Gun CRT's . . .

The inherent advantages of multi-gun cathode ray tubes are finding more and more application in systems where simultaneous, correlated display is essential.

Sylvania has custom engineered a line of multi-gun tubes—representative tube types are shown in the custom engineered cathode ray section of this brochure. These tubes feature maximum pattern linearity and deflection factor uniformity, high deflection sensitivity and maximum resolution! Multi-gun tubes have been manufactured with face diameters from 3 to 16 inches and length from 8 to 36 inches. Two, three, four, five and six gun tubes have been produced.

Theoretically there is no limit to the number of guns that can be put into a single tube.

If you have specific system re-

quirements that require special characteristics in a multi-gun tube, Sylvania will recommend a tube to fill your needs.

Fiber Optics can Increase Light Transmitting Efficiency 30 Times over conventional refractive optics in photographic recording.

This new, but proven, technique for optically coupling a cathode ray tube to a photographic film, represents a giant stride forward in recording technology. Light emitted from the phosphor screen is conducted along tiny optical fibers directly to the recording medium with virtually no distortion or loss of intensity.

In older systems using refractive optics to project the image to the film, the lens collected only a small fraction of light from the cathode ray tube screen. This resulted in a loss of clarity and detail in the recorded picture.

With fiber optics tubes, fiber

bundles are fused directly into the cathode ray tube faceplate forming a vacuum tight assembly. The phosphor screen is applied to the inside surface of the fibers, so that direct transmission is possible to the film contacting the other end of the optical path. Several fiber optics designs of this construction are available, using either circular areas or narrow rectangular strips. They normally measure about $\frac{1}{4}$ inch in thickness.

To maintain the high resolution of the fine grain screens of the CRT, fiber size must be between 4 and 15 microns.

For additional information on contact printing with fiber optics tubes, contact your nearest Sylvania sales representative.

Remarkable Low Power Heater- 1.5 v @ 140 ma.-from Sylvania..

Continuing Sylvania research into modern materials and techniques has produced a remarkable low-power heater-cathode assembly that opens new design areas for battery-powered, portable scopes. It requires only 1.5 v @ 140 ma.—less than 6% of the power normally needed—thus offering lower tube

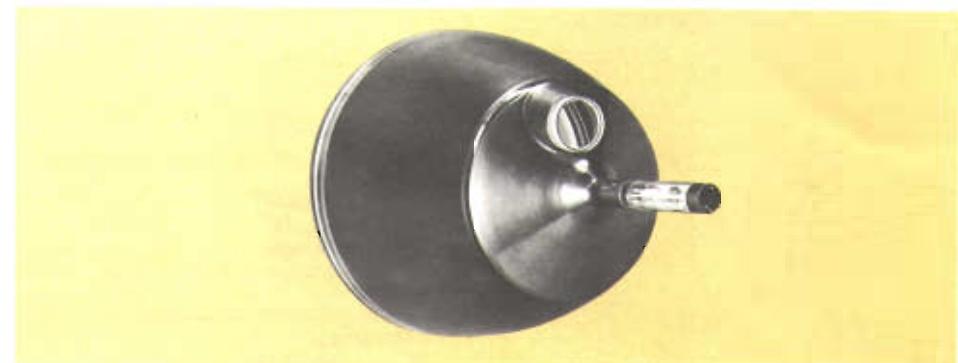

operating temperatures and low drain from battery or flyback heater supplies. Advanced powder metallurgy processes make possible a flat, pancake-like heater-cathode assembly, only .050" in diameter and .011" thick. Extreme low mass minimizes the possibility of damage from vibration and shock. It is adaptable to practically all present CRT designs.

With Sylvania's Rear Window CRT's you can Monitor and Photograph Simultaneously

Sylvania, by adding a discrete viewing window at the rear of a cathode ray tube, has made it possible to optically project overlay information onto the phosphor screen from the rear, for direct comparison with the electronic display. Sylvania's type SC-3875 is an example of such a tube. This is a large screen tube, 19 inches in diameter with a single ophthalmic quality window. It also features highly sensitive, character writing deflection plates for producing alphanumeric symbols. This tube also permits photographic recordings of the electronic image on the screen through the rear window without interfering with normal front viewing.

Multigun/multiwindow types are practical, with large or small screens. As with the SC-3875, character writing deflection plates can

be incorporated to produce changing numeric and alphanumeric symbols.

Combining the many features of rear window CRT's results in a device capable of forming a composite display from various information sources. The electron beams of the multiple guns can represent moving objects such as planes, ships, etc. Guns with character writing deflection plates will also display changing digital or alphabetical information on speed, altitude, identification, etc.

which can be programmed to accompany the appropriate "blip" as it changes position on the screen.

The rear viewing windows unobtrusively allow for both optical projection onto the phosphor screen and photographic recording of the composite picture.

If you have a complex display problem, let Sylvania's experience work for you. An off-the-shelf or a custom designed rear window cathode ray tube may solve your particular systems problem.

Sylvania High Resolution Assemblies are completely preadjusted and prealigned plug-in packages. They offer the utmost in ease of installation and flexibility in high resolution photographic recording and flying spot scanning applications.

Each assembly contains a high resolution tube, deflection coil, focusing coil (when necessary), alignment magnets and supporting hardware encased in a protective mu metal shield. With only slight modification, various types of high resolution tubes can be accommodated. A listing of available types appears in the custom engineered section of this book. 5-inch, 7-inch and 10-inch types are available.

Special features of Sylvania's high resolution CRT's include: line width down to .0008", clear non-browning faceplates, extremely fine grained aluminized screens, and integral encapsulated high voltage connectors which minimize corona at high altitude.

Assemblies are made to customer specifications. They are individually engineered for optimum application efficiency and can be installed quickly by non-technical personnel.

Hours of maintenance and down time can be saved each time repair or replacement become necessary.

Let Sylvania custom design an assembly for your application or use a predesigned package such as the AT-SK-6003/5CEP11.

* Useful scan is limited on this axis to a value less than full screen dimension.

* Line Width A for this type is approximately equal to that of the referenced type, when operating at the same beam current. Light output of other phosphors are in general lower than that of P-1.

* An ion trap magnet is required with this tube type.

General Notes

1. All voltages are measured with respect to cathode.

2. Except when otherwise specified in the Remarks column, the heater voltage and current are 6.3 volts and 600 Ma for all types.

* Useful scan is limited on this axis to a value less than full screen dimension.
 * Line Width A for this type is approximately equal to that of the referenced type, when operating at the same beam current. Light output of other phosphors are in general lower than that of P-1.

* An ion trap magnet is required with this tube type.

General Notes

- All voltages are measured with respect to cathode.
- Except when otherwise specified in the Remarks column, the heater voltage and current are 6.3 volts and 600 Ma for all types.

notes:

* Line width measured at the center of tube face by the shrinking raster method at the current or brightness specified. Reference: MIL-E-1, Par. 4.12.6.1. The brightness shown for 3" and 5" round tubes is for 2" x 2" raster size, for other types, full screen illumination.

Standard Registered Screen Phosphors

E.I.A. PHOSPHOR	FLUORESCENCE	EMISSION COLOR PHOSPHORESCENCE	PERSISTENCE	APPLICATION
P-1	Yellowish green	Yellowish green	Medium	Used in cathode ray oscilloscope and radar.
P-2	Yellowish green	Yellowish green	Medium	Used in cathode ray oscilloscopes.
P-3	Yellowish orange	Yellowish orange	Medium	
P-4	White	White	Medium to medium short	Used in monochrome television picture tubes.
P-5	Blue	Blue	Medium short	Photographic recording.
P-6	White	White	Short	Obsolete—Originally used in television receivers.
P-7	White	Yellowish green	Blue-medium short Yellowish green-long	Used for radar.
P-8	Obsolete	replaced by P-7	Dark trace-very long	Outside source of light is used for observation. Persistence from seconds to several months.
P-9	Obsolete			
P-10				
P-11	Blue	Blue	Medium short	Photographic recording.
P-12	Orange	Orange	Long	Used for radar.
P-13	Reddish orange	Reddish orange	Medium	
P-14	Purplish blue	Yellowish orange	Blue-medium short Orange-medium	Used for military displays where repetition rate is 2 to 4 seconds after excitation is removed.
P-15	Green	Green	Visible-short Ultra-violet-very short	Television pick-up of photographs by Flying Spot Scanning.
P-16	Bluish purple	Bluish purple	Very short	Television pick-up of photographs by Flying Spot Scanning.
P-17	Yellow white to blue white	Yellow	Blue-short Yellow-long	Used for military displays.
P-18	White	White	Medium to Medium short	Low frame rate television.
P-19	Orange	Orange	Long	Radar indicators.
P-20	Yellow green	Yellow green	Medium to medium short	High visibility displays.
P-21	Reddish orange	Reddish orange	Medium	
P-22	Tricolor phosphor screen		Medium short	Used for color television.
P-23	White	White	Medium short	Low temperature white—(Sepia) Interchangeable with P-4.
P-24	Green	Green	Short	Used in Flying Spot Scanner tubes.
P-25	Orange	Orange	Medium	Used for military displays where repetition rate is 10 seconds, to 2 minutes after excitation is removed.
P-26	Orange	Orange	Very long	Used for radar display.
P-27	Reddish orange	Reddish orange	Medium	Color Television Monitor Service.
P-28	Yellow green	Yellow green	Long	Used for radar display.
P-29	Two color phosphor screen		Medium	Used as indicator in aircraft instruments.
P-30*	—	—	—	—
P-31	Green	Green	Medium-short	Used in cathode ray oscilloscopes.
P-32	Purple-blue	Yellow green	Long	Used for radar display.
P-33	Orange	Orange	Very long	Used for radar display.
P-34	Bluish green	Yellow green	Very long	Used for oscillography, radar and visual information storage.
P-35	Green	Green	Medium short	Used for photographic recording on Orthochromatic film and visual observation.
